Propriété d'un consortium d'universités canadiennes, géré en co-entreprise à partir d'une contribution administrée par le Conseil national de recherches Canaca

 The nucleus-nucleus bremsstrahlung is a specific bremsstrahlung where the photon emission is induced by a collision between two nuclei or a nucleus and a neutron.

RTRIUMF

A part of the kinetic energy between the nuclei is converted to a photon.

Introduction

< ロ > < 同 > < 三 > < 三 > 、 三 > へ ○ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

The study of the nucleus-nucleus bremsstrahlung should enable us

- to describe the radiative transitions between unstable states (cf. recent measurements of "4+-to-2+" gamma transitions in ⁸Be from the α(α, ααγ) bremsstrahlung)
 [V. M. Datar *et al.*, Phys. Rev. Lett. 94, (2005) 122502]
 [V. M. Datar *et al.*, Phys. Rev. Lett. 111 (2013) 062502]
- to describe the t(d, nγ)α radiative transfer reaction (perspective to diagnose plasmas in fusion experiments from this reaction)
 [T. J. Murphy *et al.*, Rev. Sci. Instrum. 72 (2001) 773]
- to provide the cluster wave functions (phase-equivalent potentials can lead to different bremsstrahlung cross sections)

[D. Baye, P. Descouvemont, and M. Kruglanski, Nucl. Phys. A 550 (1992) 250]

(ロ) (同) (E) (E) (E) (O) (O)

 Since the electromagnetic forces are much weaker than the nuclear ones, the electromagnetic emission process can be seen as a small perturbation of the elastic scattering.

TRIUMF

- \Rightarrow necessity to have a fair description of the elastic scattering
- \Rightarrow necessity to follow *ab initio* and effective approaches

Outline

· Describing the elastic scattering by a microscopic approach

- effective and realistic internucleon interactions
- resonating-group method (RGM) and the no-core shell model/RGM
- Application to the α + N scattering and comparison with the experiment
- Describing the bremsstrahlung by a microscopic approach
 - Electric transition multipole operators from the nuclear current
 - Siegert approach: electric transition multipole operators from the charge density
 - Comments about the calculation of the matrix elements
 - Application to the $\alpha + N$ bremsstrahlung (in the effective approach)
 - (Very) preliminary results for the $\alpha + p$ bremsstrahlung with the NCSM/RGM

Microscopic approach

For an A-nucleon system, in non-relativistic microscopic model, all physical quantities are derived from the internal many-body Schrödinger equation

$$H\Psi = \left(\sum_{i=1}^{A} \frac{p_i^2}{2m_N} + \sum_{i>j=1}^{A} v_{ij} + \sum_{i>j>k=1}^{A} v_{ijk} - T_{\text{c.m.}}\right)\Psi = E_T\Psi,$$

where

- $p_i^2/2m_N$ is the kinetic energy of nucleon *i*
- v_{ij} is a two-body interaction between nucleons i and j
- *v_{ijk}* is a three-body interaction between nucleons *i*, *j*, and *k*
- T_{c.m.} is the kinetic energy of the center of mass

Internucleon interaction

Two types of internucleon interaction are considered:

- an effective NN interaction (Minnesota potential)
 - central and spin-orbit part
 - soft potential adapted to simple cluster wave function
 - one or two parameters fitted to reproduce the elastic phase shifts of the considered collision
- a realistic NN(+NNN) interactions (chiral NN+NNN interaction renormalized by SRG)
 - reproduces very well the NN phase shifts
 - "no free parameter"
 - requires a quite large model space to converge

Resonating-group method

In the RGM, the wave function is expanded as a sum of cluster functions,

 $\mathcal{A} \Phi_1(\boldsymbol{\xi}^{(1)}) \Phi_2(\boldsymbol{\xi}^{(2)}) g(\boldsymbol{\rho})$

Resonating-group method

< ロ > < 同 > < 三 > < 三 > 、 三 > へ ○ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

In the RGM, the wave function is expanded as a sum of cluster functions,

$$\Psi^{JM_{\pi};TM_{T}} = \sum_{\nu} \mathcal{A} \Phi_{\nu}^{JM_{\pi};TM_{T}} \left(\boldsymbol{\xi}^{(1)},\boldsymbol{\xi}^{(2)},\Omega_{\rho}\right) \frac{g_{\nu}^{J_{\pi};TM_{T}}(\rho)}{\rho}$$

where

$$\Phi_{\nu}^{\mathcal{J}M\pi;TM_{T}}\left(\boldsymbol{\xi}^{(1)},\boldsymbol{\xi}^{(2)},\Omega_{\rho}\right) = \left[\left[\Phi_{\nu_{1}}^{l_{\nu_{1}}\pi_{\nu_{1}};T_{\nu_{1}}}\left(\boldsymbol{\xi}^{(1)}\right)\Phi_{\nu_{2}}^{l_{\nu_{2}}\pi_{\nu_{2}};T_{\nu_{2}}}\left(\boldsymbol{\xi}^{(2)}\right)\right]^{l;TM_{T}}Y_{\ell}(\Omega_{\rho})\right]^{\mathcal{J}M\pi}$$

and $\nu = \nu_1 \nu_2 I \ell$. Two types of internal wave functions of the clusters are considered • $\Phi_{\nu_1}^{l_{\nu_1} \pi_{\nu_1}; T_{\nu_1}}$ and $\Phi_{\nu_2}^{l_{\nu_2} \pi_{\nu_2}; T_{\nu_2}}$ are the goundstate waves functions in the harmonic-oscillator shell model (Ex: α described by a (0s)⁴ state)

• $\Phi_{\nu_1}^{l_{\nu_1}\pi_{\nu_1};T_{\nu_1}}$ and $\Phi_{\nu_2}^{l_{\nu_2}\pi_{\nu_2};T_{\nu_2}}$ are the NCSM eigenstates of the clusters for the considered nuclear interaction (\rightarrow NCSM/RGM).

Resonating-group method

(日)

Inserting the RGM expansion in the variational form of the Schrödinger equation

$$\langle \delta \Psi^{JM\pi;TM_T} | H - E_T | \Psi^{JM\pi;TM_T} \rangle = 0,$$

leads to the RGM equations

$$\sum_{\nu}\int r^2 [\mathcal{H}_{\nu'\nu}^{JM\pi;TM_T}(r',r)-E_T \mathcal{N}_{\nu'\nu}^{JM\pi;TM_T}(r',r)]\frac{g_{\nu}^{J\pi;TM_T}(r)}{r}dr=0,$$

where

$$\mathcal{H}_{\nu'\nu}^{JM\pi;TM_{T}}(r',r) = \langle \Phi_{\nu'}^{JM\pi;TM_{T}} \frac{\delta(\rho-r')}{\rho r'} | \mathcal{A}^{\dagger} H \mathcal{A} | \Phi_{\nu}^{JM\pi;TM_{T}} \frac{\delta(\rho-r)}{\rho r} \rangle$$

$$\mathcal{N}_{\nu'\nu}^{JM\pi;TM_{T}}(r',r) = \langle \Phi_{\nu'}^{JM\pi;TM_{T}} \frac{\delta(\rho-r')}{\rho r'} | \mathcal{A}^{\dagger} \mathcal{A} | \Phi_{\nu}^{JM\pi;TM_{T}} \frac{\delta(\rho-r)}{\rho r} \rangle$$

Comment

By expanding $g_{\nu}^{J_{\mu}\tau;TM_{T}}$ as a sum of projected Gaussians, RGM \Rightarrow Generator-coordinate method (GCM) \Rightarrow Kernels are matrix elements between Slater determinants (cf. Daniel Baye's talk)

Bremsstrahlung cross sections

The calculation of bremsstrahlung cross sections is based on the matrix elements

$$\langle \Psi_f^-(\Omega_f) | \mathcal{M}^{\sigma}_{\lambda\mu} | \Psi_i^+ \rangle,$$

where

- Ψ⁺_i is the initial incoming state in the z direction
- Ψ⁻_f(Ω_f) is the final outgoing state
- $\mathcal{M}^{\sigma}_{\lambda\mu}$ are the electromagnetic transition multipole operators, which are defined by

$$\mathfrak{M}^{\sigma}_{\lambda\mu} = (-i)^{\sigma} \sqrt{\frac{\lambda}{\lambda+1}} \frac{(2\lambda+1)!!}{k_{\gamma}^{\lambda} c} \int \boldsymbol{J}(\boldsymbol{r}) \cdot \boldsymbol{A}^{\sigma}_{\lambda\mu}(\boldsymbol{r}) \mathrm{d}\boldsymbol{r},$$

where **J** is the intrinsic nuclear current density and $\mathbf{A}^{\sigma}_{\lambda\mu}$ are the electromagnetic multipole operators.

• Since the electric transitions dominate at low photon energies, the magnetic transitions are not considered here.

Electric transitions

(ロ) (同) (E) (E) (E) (O) (O)

$$\mathcal{M}_{\lambda\mu}^{\mathrm{E}} = (-i)^{\sigma} \sqrt{\frac{\lambda}{\lambda+1}} \frac{(2\lambda+1)!!}{k_{\gamma}^{\lambda} c} \int \boldsymbol{J}(\boldsymbol{r}) \cdot \boldsymbol{A}_{\lambda\mu}^{\mathrm{E}}(\boldsymbol{r}) \mathrm{d}\boldsymbol{r},$$

 The nuclear current is caused by the motion of the nucleons and also by the motion of the mesons which are responsible for the nucleon-nucleon (NN) interaction

Difficulties

- J depends on the considered NN potential (More complex is the NN potential, more complex is the current)
- J is not defined unequivocally.

These difficulties can be bypassed at low-photon energies by using an extended Siegert theorem, which enables us to reduce the nuclear current dependence.

References

K.-M. Schmitt, P. Wilhelm, H. Arenhovel, A. Cambi, B. Mosconi, and P. Ricci, Phys. Rev. C41, 841 (1990). JDE, D. Baye, Phys. Rev. C88 (2013) 024602.

Extended Siegert theorem

$$\mathcal{M}_{\lambda\mu}^{\rm E} = \sqrt{\frac{\lambda}{\lambda+1}} \frac{(2\lambda+1)!!}{k_{\gamma}^{\lambda} c} \int \boldsymbol{J}(\boldsymbol{r}) \cdot \boldsymbol{A}_{\lambda\mu}^{\rm E}(\boldsymbol{r}) \mathrm{d}\boldsymbol{r},$$

where

$$\boldsymbol{A}_{\lambda\mu}^{\mathrm{E}}(\boldsymbol{r}) = \frac{i}{k_{\gamma}\sqrt{\lambda(\lambda+1)}} \left(k_{\gamma}^{2}\boldsymbol{r} + \boldsymbol{\nabla}\frac{\partial}{\partial \boldsymbol{r}}\boldsymbol{r}\right) j_{\lambda}(k_{\gamma}\boldsymbol{r}) Y_{\lambda\mu}(\Omega)$$

• The deletion of the current dependence of the electric transition at low photon energies relies on the fact that $\mathbf{A}_{\lambda\mu}^{\rm E}$ is reduced to a gradient term at the long-wavelength approximation,

$$\boldsymbol{A}_{\lambda\mu}^{\mathrm{E}}(\boldsymbol{r}) \underset{k_{\gamma} \to 0}{\longrightarrow} \frac{i\sqrt{\lambda+1}k_{\gamma}^{\lambda-1}}{\sqrt{\lambda}(2\lambda+1)!!} \boldsymbol{\nabla} \boldsymbol{r}^{\lambda} \boldsymbol{Y}_{\lambda}^{\mu}(\Omega).$$

 BUT the long-wavelength approximation cannot be done. Since the initial and final states are in the continuum, the wave functions are not square-integrable and the long-wavelength approximation leads to divergent integrals.

RIUMF

Extended Siegert theorem

A B A B A B A QQ

• To reduce the current dependence without applying the long-wavelength approximation, the idea is to introduce an approximate electric transition multipole operator, denoted by $\widetilde{\mathcal{M}}^{E}_{\lambda\mu}$, in which $\boldsymbol{A}^{E}_{\lambda\mu}$ is approximate only by a gradient term

$$\widetilde{\mathfrak{M}}^{\mathrm{E}}_{\lambda\mu} = \sqrt{\frac{\lambda}{\lambda+1}} \frac{(2\lambda+1)!!}{k_{\gamma}^{\lambda} c} \int \boldsymbol{J}(\boldsymbol{r}) \cdot \boldsymbol{\nabla} \Phi_{\lambda\mu}(\boldsymbol{r}) \mathrm{d}\boldsymbol{r},$$

where

$$\frac{||\boldsymbol{\nabla} \Phi_{\lambda\mu}||}{||\boldsymbol{A}_{\lambda\mu}^{\mathrm{E}}||} \underset{k_{\gamma} \to 0}{\longrightarrow} 1.$$

Possible choice:

$$\Phi_{\lambda\mu}(\mathbf{r}) = rac{i\sqrt{\lambda+1}}{k_{\gamma}\sqrt{\lambda}} j_{\lambda}(k_{\gamma}r) Y_{\lambda\mu}(\Omega).$$

After integrating by parts and by using the continuity equation

$$\boldsymbol{\nabla}\cdot\boldsymbol{J}(\boldsymbol{r})+rac{i}{\hbar}[H,
ho(\boldsymbol{r})]=0$$

where ρ is the charge density, the operator $\widetilde{\mathcal{M}}^{\mathrm{E}}_{\lambda\mu}$ can be written as

$$\widetilde{\mathfrak{M}}^{\mathrm{E}}_{\lambda\mu} = i \sqrt{\frac{\lambda}{\lambda+1}} \frac{(2\lambda+1)!!}{k_{\gamma}^{\lambda} \hbar c} \int [H, \rho(\boldsymbol{r})] \Phi_{\lambda\mu}(\boldsymbol{r}) \mathrm{d}\boldsymbol{r}.$$

Extended Siegert theorem

$$\widetilde{\mathfrak{M}}^{\mathrm{E}}_{\lambda\mu} = i \sqrt{\frac{\lambda}{\lambda+1}} \frac{(2\lambda+1)!!}{k_{\gamma}^{\lambda} \hbar c} \int [H, \rho(\boldsymbol{r})] \Phi_{\lambda\mu}(\boldsymbol{r}) \mathrm{d}\boldsymbol{r}.$$

In the calculation of the matrix elements between Ψ_{f}^{-} and Ψ_{i}^{+} , $\widetilde{\mathcal{M}}_{\lambda\mu}^{E}$ is equivalent to

$$\widetilde{\mathfrak{M}}_{\lambda\mu}^{\mathrm{E(S)}} = -i\sqrt{\frac{\lambda}{\lambda+1}} \frac{(2\lambda+1)!!}{\kappa_{\lambda}^{\lambda-1}} \int \rho(\boldsymbol{r}) \Phi_{\lambda\mu}(\boldsymbol{r}) \mathrm{d}\boldsymbol{r}.$$

- $\widetilde{\mathcal{M}}^{E}_{\lambda\mu}$ and $\widetilde{\mathcal{M}}^{E(S)}_{\lambda\mu}$ lead to the same results if consistent current and charge densities and exact eigenstates of the Hamiltonian are used.
- $\widetilde{\mathcal{M}}^{E(S)}_{\lambda\mu}$ depends on the charge density but not on the current density.

Extended Siegert theorem

Back to the "exact" electric transition multipole operator. It can be written as

$$\mathfrak{M}^{\mathrm{E}}_{\lambda\mu} = \widetilde{\mathfrak{M}}^{\mathrm{E}}_{\lambda\mu} + (\mathfrak{M}^{\mathrm{E}}_{\lambda\mu} - \widetilde{\mathfrak{M}}^{\mathrm{E}}_{\lambda\mu}).$$

By analogy, the Siegert form can be defined as

$$\mathfrak{M}^{\mathrm{E}(\mathrm{S})}_{\lambda\mu} = \widetilde{\mathfrak{M}}^{\mathrm{E}(\mathrm{S})}_{\lambda\mu} + (\mathfrak{M}^{\mathrm{E}}_{\lambda\mu} - \widetilde{\mathfrak{M}}^{\mathrm{E}}_{\lambda\mu}).$$

- $\mathcal{M}^{E}_{\lambda\mu}$ and $\mathcal{M}^{E(S)}_{\lambda\mu}$ lead exactly to the same results if consistent current and charge densities are considered and the exact eigenstates of the Hamiltonian are used.
- At low photon energies, the contribution of $\widetilde{\mathcal{M}}_{\lambda\mu}^{E(S)}$ dominates
- The operator $\mathcal{M}^{E(S)}_{\lambda\mu}$ should be preferred in microscopic calculations because

 - 1. it leads to easier calculations than $\mathfrak{M}^{E}_{\lambda\mu}$ 2. the charge density is better known than the current density
 - to avoid derivatives of the wave functions which are known less accurately than the wave function itself

CTRIUMF

Charge and current densities

· Charge and current densities for free nucleons are considered

$$\begin{split} \rho(\mathbf{r}) &= e \sum_{j=1}^{A} (\frac{1}{2} - t_{j3}) \delta(\mathbf{r}_{j} - \mathbf{R}_{\text{c.m.}} - \mathbf{r}), \\ \mathbf{J}(\mathbf{r}) &= \frac{e}{2m_{N}} \sum_{j=1}^{A} (\frac{1}{2} - t_{j3}) \left[\mathbf{p}_{j} - \mathbf{A}^{-1} \mathbf{P}_{\text{c.m.}}, \delta(\mathbf{r}_{j} - \mathbf{R}_{\text{c.m.}} - \mathbf{r}) \right]_{+} \\ &+ \frac{e}{2m_{N}} \sum_{j=1}^{A} g_{sj} \nabla \times \delta(\mathbf{r}_{j} - \mathbf{R}_{\text{c.m.}} - \mathbf{r}) \mathbf{s}_{j}, \end{split}$$

where $[a, b]_+$ is a shorthand notation for $a \cdot b + b \cdot a$ and g_{sj} is the gyromagnetic factor.

CTRIUMF

Electric transition multipole operators

• The non-Siegert electric transition multipole operators are given explicitly by

$$\begin{split} \mathcal{M}_{\lambda\mu}^{\mathrm{E}} = & \frac{i e(2\lambda+1)!!}{m_{N} c(\lambda+1) k_{\gamma}^{\lambda+1}} \sum_{j=1}^{A} \left[\left(\frac{1}{2} - t_{j3} \right) \chi_{\lambda\mu}(k_{\gamma}, \mathbf{r}) \cdot \left(\mathbf{p}_{j} - A^{-1} \mathbf{P}_{\mathrm{c.m.}} \right) \right. \\ & \left. - \frac{1}{2} k_{\gamma}^{2} g_{sj}(\mathbf{r} \times \boldsymbol{\nabla}) \phi_{\lambda\mu}(k_{\gamma} \mathbf{r}) \cdot \mathbf{s}_{j} \right]_{\mathbf{r} = \mathbf{r}_{j} - \mathbf{R}_{\mathrm{c.m.}}}, \end{split}$$

where

$$\chi_{\lambda\mu}(k_{\gamma}, \mathbf{r}) = \left(k_{\gamma}^{2}\mathbf{r} + \nabla\frac{\partial}{\partial r}r\right)\phi_{\lambda\mu}(k_{\gamma}\mathbf{r}),$$
$$\phi_{\lambda\mu}(k_{\gamma}\mathbf{r}) = j_{\lambda}(k_{\gamma}r)Y_{\lambda\mu}(\Omega).$$

Electric transition multipole operators

• The Siegert electric transition multipole operators are given explicitly by

$$\begin{split} \mathcal{M}_{\lambda\mu}^{\mathrm{E}(\mathrm{S})} = & \frac{e(2\lambda+1)!!}{k_{\gamma}^{\lambda}} \sum_{j=1}^{A} \left(\frac{1}{2} - t_{j3}\right) \phi_{\lambda\mu} \left[k_{\gamma} \left(\mathbf{r}_{j} - \mathbf{R}_{\mathrm{c.m.}}\right)\right] \\ &+ \frac{ie(2\lambda+1)!!}{2m_{N}c(\lambda+1)k_{\gamma}^{\lambda+1}} \sum_{j=1}^{A} \left\{ \left(\frac{1}{2} - t_{j3}\right) \right. \\ & \left[\chi_{\lambda\mu}(k_{\gamma}, \mathbf{r}) - (\lambda+1)\nabla\phi_{\lambda\mu}(k_{\gamma}\mathbf{r}), \mathbf{p}_{j} - \mathbf{A}^{-1}\mathbf{P}_{\mathrm{c.m.}}\right]_{+} \\ & \left. -k_{\gamma}^{2}g_{sj}(\mathbf{r}\times\nabla)\phi_{\lambda\mu}(k_{\gamma}\mathbf{r}) \cdot \mathbf{s}_{j} \right\}_{\mathbf{r}=\mathbf{r}_{j}-\mathbf{R}_{\mathrm{c.m.}}}. \end{split}$$

RIUMF

Calculation of the matrix elements

The reduced matrix element of ${\mathfrak M}_\lambda$ $({\mathfrak M}^E_\lambda$ or ${\mathfrak M}^{E(S)}_\lambda)$ is approximated with a good accuracy by

$$\begin{aligned} \langle \Psi^{J_{f}\pi_{f};T_{f}}||\mathfrak{M}_{\lambda}||\Psi^{J_{i}\pi_{i};T_{i}}\rangle &= \langle \Psi^{J_{f}\pi_{f};T_{f}}_{\mathrm{int}}||\mathfrak{M}_{\lambda}||\Psi^{J_{i}\pi_{i};T_{i}}_{\mathrm{int}}\rangle_{\mathrm{int}} + \langle \Psi^{J_{f}\pi_{f};T_{f}}_{\mathrm{ext}}||\mathfrak{M}_{\lambda}||\Psi^{J_{f}\pi_{i};T_{i}}_{\mathrm{ext}}\rangle_{\mathrm{ext}} \\ &\approx \langle \Psi^{J_{f}\pi_{f};T_{f}}_{\mathrm{int}}||\widehat{\mathfrak{M}}_{\lambda}||\Psi^{J_{f}\pi_{f};T_{i}}_{\mathrm{int}}\rangle_{\mathrm{int}} + \langle \Psi^{J_{f}\pi_{f};T_{f}}_{\mathrm{ext}}||\mathfrak{M}^{\lambda}_{\mathrm{ext}}||\Psi^{J_{f}\pi_{i};T_{i}}_{\mathrm{ext}}\rangle_{\mathrm{ext}} \end{aligned}$$

where $\widehat{\mathfrak{M}}_{\lambda}$ is the long-wavelength approximation of \mathfrak{M}_{λ} and the superscript as designates the asymptotic form of the multipole operator.

- Over the external region, the antisymmetrization between clusters can be neglected.
- The long-wavelength approximation can be done for the matrix elements between the internal parts of the wave functions because they are square-integrable

$$\begin{split} \widehat{\mathfrak{M}}_{\lambda\mu}^{\mathrm{E}} &= \frac{ie}{m_{N}ck_{\gamma}} \sum_{j=1}^{A} \left(\frac{1}{2} - t_{j3}\right) \left[\boldsymbol{\nabla} r^{\lambda} Y_{\lambda}^{\mu}(\Omega)\right]_{\boldsymbol{r}_{j}-\boldsymbol{R}_{\mathrm{c.m.}}} \cdot \left(\boldsymbol{p}_{j} - A^{-1} \boldsymbol{P}_{\mathrm{c.m.}}\right) \\ \widehat{\mathfrak{M}}_{\lambda\mu}^{\mathrm{E}(\mathrm{S})} &= \boldsymbol{e} \sum_{j=1}^{A} \left(\frac{1}{2} - t_{j3}\right) \left[r^{\lambda} Y_{\lambda}^{\mu}(\Omega)\right]_{\boldsymbol{r}_{j}-\boldsymbol{R}_{\mathrm{c.m.}}} \end{split}$$

SQC

RIUMF

$E\lambda$ operator in the RGM/GCM

- In the GCM, the calculation of the matrix elements of the electric multipole can be done by using the single-nucleon coordinates
- The evaluation of the E λ matrix elements requires the calculation of matrix elements of the one-body operator

$$\widehat{\mathfrak{M}}_{\lambda\mu}^{\mathrm{E}} = \frac{ie}{m_{N}ck_{\gamma}}\sum_{j=1}^{A} \left(\frac{1}{2} - t_{j3}\right) \left[\boldsymbol{\nabla} t_{j}^{\lambda} Y_{\lambda}^{\mu}(\Omega_{j})\right] \cdot \boldsymbol{p}_{j}$$

in the non-Siegert approach and

$$\widehat{\mathfrak{M}}_{\lambda\mu}^{\mathrm{E(S)}} = \boldsymbol{e} \sum_{j=1}^{\boldsymbol{A}} \left(\frac{1}{2} - t_{j3} \right) \left[\boldsymbol{r}_{j}^{\lambda} \boldsymbol{Y}_{\lambda}^{\mu}(\Omega_{j}) \right]$$

in the Siegert approach evaluated between Slater determinants.

• \Rightarrow systematic calculation

E1 operator in the NCSM/RGM

◆□ > ◆□ > ◆□ > ◆□ > → □ → ○ < ♡ < ♡

E1 operator in the Siegert approach can be written in vector notation as

$$\mathbf{E1} = \mathbf{e} \sum_{j=1}^{A} \left(\frac{1}{2} - t_{j3} \right) \left(\mathbf{r}_{j} - \mathbf{R}_{c.m.} \right)$$

$$= \mathbf{e} \sum_{j=1}^{A_{1}} \left(\frac{1}{2} - t_{j3} \right) \left(\mathbf{r}_{j} - \mathbf{R}_{c.m.}^{(1)} \right) + \mathbf{e} \sum_{j=A_{1}+1}^{A} \left(\frac{1}{2} - t_{j3} \right) \left(\mathbf{r}_{j} - \mathbf{R}_{c.m.}^{(2)} \right) + \mathbf{e} Z_{eff}^{(1)} \rho$$

$$= \mathbf{E1}(1) + \mathbf{E1}(2) + \mathbf{e} Z_{eff}^{(1)} \rho$$

where

$$Z_{\rm eff}^{(\lambda)} = Z_1 \left(\frac{A_2}{A}\right)^{\lambda} + Z_2 \left(\frac{-A_1}{A}\right)^{\lambda}$$

E1 operator in the NCSM/RGM

For $\alpha + p$,

$$E1 = E1(1) + E1(2) + eZ_{eff}^{(1)}\rho$$
$$= -e\sum_{i=1}^{A-1} r_i t_{i3} + eZ_{eff}^{(1)}\rho$$

- matrix element of $eZ_{\rm eff}^{(1)}\rho$ calculated from the norm kernels (already required for the scattering calculation)
- matrix element of −e∑^{A−1}_{i=1} r_it_{i3} calculated from the one-body and two-body density matrix elements of the α (already required for the scattering calculation)
- Required some method for eliminating the center-of-mass motion for an operator which modifies parity, angular momentum, and isospin.
- Required to apply the SRG transform to obtain very accurate results (cf. Sofia Quaglioni's talk).

Effective charge

• The ratio of the orders of magnitude of the electric transition contributions can be explained by comparing the effective charges defined by

$$Z_{\rm eff}^{(\lambda)} = Z_1 \left(\frac{A_2}{A}\right)^{\lambda} + Z_2 \left(\frac{-A_1}{A}\right)^{\lambda}$$

• In first approximation, the ratio between the contributions of a given electric transition for the $\alpha + p$ and $\alpha + n$ bremsstrahlung cross sections is given by the square of the ratio between the effective charges

$$\frac{\mathrm{d}\sigma(\alpha p, \mathrm{E}\lambda)}{\mathrm{d}\sigma(\alpha n, \mathrm{E}\lambda)} \approx \left(\frac{Z_{\mathrm{eff}, \alpha p}^{(\lambda)}}{Z_{\mathrm{eff}, \alpha n}^{(\lambda)}}\right)^2$$

Summary

(ロ) (同) (E) (E) (E) (O) (O)

- A microscopic approach of the nucleus-nucleus bremsstrahlung is presented, which is based on elastic wave functions deduced from an internucleon interaction.
- The microscopic model based on an effective NN interaction (the Minnesota potential) reproduces rather well the experimental bremsstrahlung cross sections for $\alpha + N$.
- A Siegert approach of bremsstrahlung is developed, which takes partially the meson-exchange currents into account.
- The Siegert operator leads to less complicated calculations than the non-Siegert one, which makes easier the development of *ab initio* bremsstrahlung models (*in progress*).
